

ABSTRACT OF THE DISCLOSURE

In a disk storage apparatus which can
concurrently process a plurality of data streams
specified by a host, it is determined whether an error
5 has occurred in a write operation specified by a write
command being executed. If it is determined that an
error has occurred, the write command is retried
regardless of whether or not the time spent performing
the write operation until the present time is within a
10 time limit specified by the write command.
